

Improve your credit reporting operations with data quality

Errors are consumers' #1 complaint about credit reporting. But, let's face it, current practices are too manual, reactive, and time-consuming. **Here are some ideas to help you proactively manage your credit reporting and avoid costly disputes, improving your customer experience.**

Create a culture that uses data-driven processes

Designate people in your organization to form, monitor, and maintain data quality standards. These people can monitor monthly reporting processes and disputes to identify trends and recommend solutions.

STEP 01

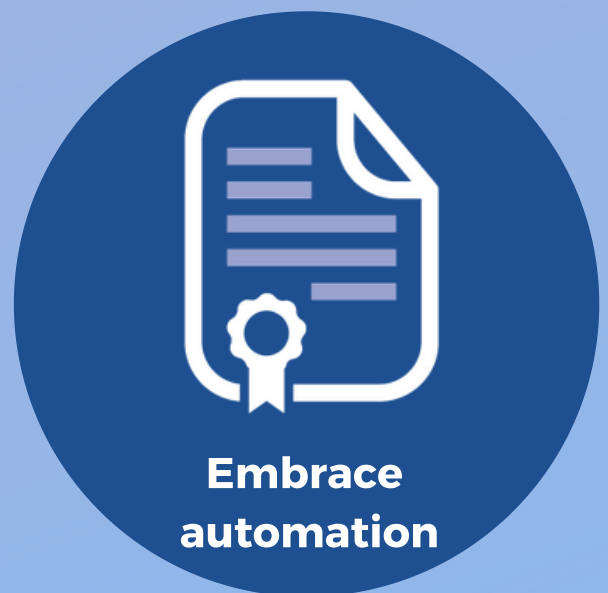

Run routine data quality checks

STEP 02

Perform regular data quality audits to assess the state of your data. Data profiling helps you perform root cause analysis and catch red flags early on.

STEP 03

Embrace automation

STEP 04

Automating processes can keep your data quality practices running even when you're off the clock. This can help you manage quality standards continuously and can provide alerts when you are running below a set threshold.

STEP 05

Clean your data

Prioritize and manage data transformations to improve the quality of your data. This includes relationship linking to remove duplicates and investigating anomalies in the data with the appropriate stakeholders.

Use technology to ease the burden

Current practices for resolving credit disputes are reactive and generally time-consuming. The right tools can help you catch errors proactively, check compliance with specific Metro 2® requirements, and visualize data quality through user-friendly dashboards.

Set yourself up for success by being proactive with your credit reporting practices. **Experian's DataArc 360™ is your ally for forward-looking credit reporting.**
